Der deutsche Virologe Christian Drosten zeigt sich angesichts der bisherigen Erkenntnisse über die indische Corona-Variante B.1.617 weiter relativ gelassen

Im Moment halte er die Variante B.1.617 "in der Medienbewertung überschätzt", sagte Drosten. Auch gebe es keine Belege, dass Menschen durch sie schwerer erkrankten.

So far, 26 countries, including India, have shared 178 SARS-CoV-2 genome sequences with the GISAID. At 70, China has shared the highest number of sequences. The other countries that have shared higher number of sequences are the U.S. (22), Australia and Japan (10 each), and Singapore and South Korea (eight each). Nepal, Vietnam and Cambodia have also shared one sequence each.

75% of adverse deaths in India within 3 days of jab, says study

Serious Events In India, EU, UK Bear Striking Similarities

Bhama Nagarajan
@timesgroup.com

A presentation made to the National AEFI (adverse event following immunisation) Committee on March 31 recorded that there had been 100 deaths till that time and three-fourths of the deaths happened within three days of the shot.

In other serious adverse events too, the overwhelming majority took place in the three-day window. Even as AEFI deaths are reported daily causality assessment by the National AEFI Committee appears to be lagging with information about just 10 deaths in the public domain.

Many of the AEFIs and deaths reported in India bear striking similarities to those recorded in the European Union and the UK, on the basis of which European Medicines Agency (EMA) has warned "healthcare professionals and people receiving the vaccine to remain aware of the possibility of very rare cases of blood clots combined with low levels of blood

RED LINE OF NO CONTROL

Sandeep Ashwary

platelets occurring within 2 weeks of vaccination".

Public health activists who have been tracking adverse events following immunisation (AEFI) in the ongoing covid vaccination effort have repeatedly sought greater transparency in AEFI investigations and more rapid causality assessments to help inform vaccination policy.

After initial denial, the European Union and the UK medicine regulators, following detailed investigation, have concluded that there is a possible link between some blood clotting events with low platelets

and the Oxford Astra Zeneca vaccine and have asked for these to be listed as "extremely rare potential side-effects". However, they have asked for the vaccination to continue as benefits still outweigh risks.

The presentation to National AEFI Committee on March 31, showed that over 90% of AEFI hospitalisations (276/305), more than 87% of cases of severe AEFI (65/69) and 93 out of 124 deaths happened within three days of the vaccination.

Out of 86 such events reported in the EU and UK where 25 million people had received the vaccine, 18 were fatal.

India reviewing 700 severe events reported after vaccination

Sushmi Dey@timesgroup.com

New Delhi: India is reviewing around 700 'severe and serious' adverse events reported from across the country after Covid vaccination in light of global concerns over rare or unusual type of blood clots after receiving AstraZeneca-Oxford University vaccine, officials said.

"We are monitoring the cases and relooking at some of the unusual technical parameters in the wake of the reports by the European regulator and the report by WHO," a senior official, member of the national committee on adverse events following immunisation (AEFI) said.

In India, experts are looking at adverse events from both Covishield, as well as Bharat Biotech's Covaxin. The result of the analysis is likely to be finalised by end of this week. The official said the review is significant as globally regulators are waiting for India's data because of the sheer number of doses administered here.
